

Ghostpress
Bulletproof anti-keylogger

Features

Ghostpress is an anti-keylogging software that prevent malicious software from capturing your keyboard presses.

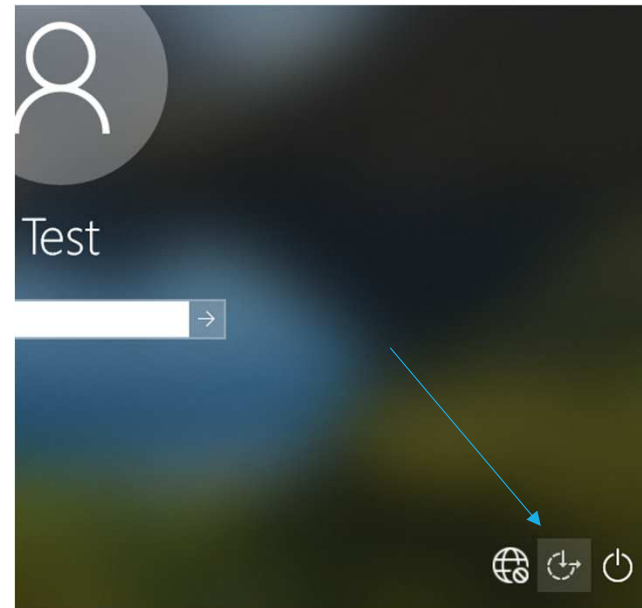

Winlogon support

By enabling this feature you will be able to launch Ghostpress in all Winlogon sessions.
This feature requires Windows 8 or newer.

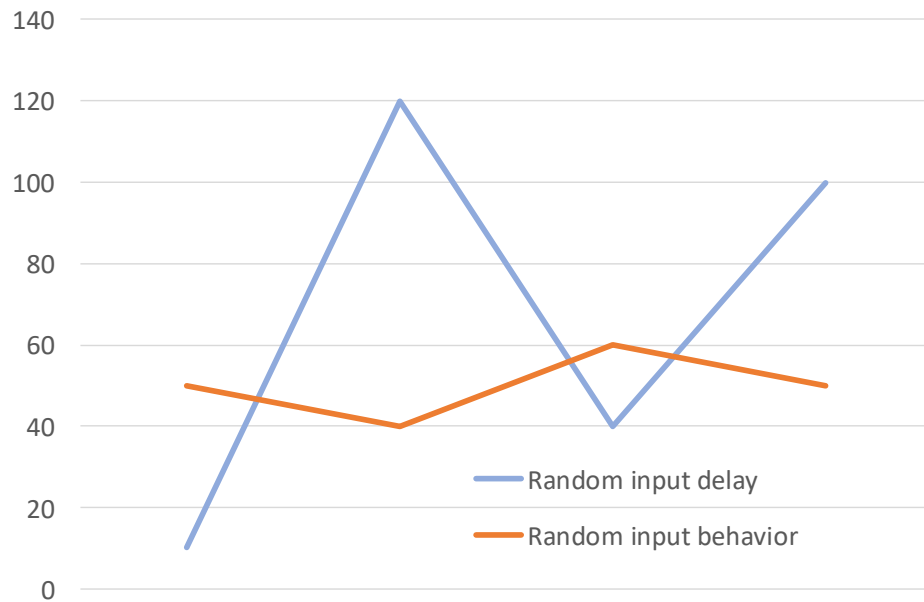

Click & go

Simply click "Ease of access"
Your first click launches Ghostpress
and all further ones will act as usual.

Delay protection

Example delay for pressing the same button

1

What is delay protection?

This feature literally delays the key events for a specific time in order to prevent supervision by the way you type.

2

When do I need delay protection?

This optional feature is made for people who want to ensure that the typing behavior is not the same in order to get identified. Otherwise we do not recommend to enable this feature.

3

What is random input delay?

This setting delays each key event for a specific random time. There will never be a same pattern or a same delay between two key events unless it is randomized that way.

4

What is random input behavior?

This setting uses two random parameters. First of all a smaller random value like "random input delay" and another generated value for the current key. The generated value is safely generated by a cryptographic number generator and stored until Ghostpress restarts. This spoofs a specific typing behavior temporary.

Command line

For an individual use of Ghostpress you can use optional start parameters.

Ghost mode (commercial)

This mode starts Ghostpress without UI or visible options, just enabled protection. This option is aware of previous settings. Recommended for: Automation. Simply start Ghostpress with following argument “-ghost”

Autostart mode

Unless closed with disabled protection Ghostpress will start with Windows via “-autostart” with hidden UI and, if enabled, visible widget.

Hidden features

You can edit Ghostpress.ini and enable optional features which may not be fully tested or cause problems. Do not change any undocumented variables!

1

Protect more keys

ForceProtection_Tab=1
ForceProtection_Enter=1

2

Disable print key

ForceBlock_Print=1

3

Delay unprotected keys as well

ForceDelay_All_Keys=1

4

Show Ghostpress in taskbar

ForceTaskbar=1

5

Force basic protection only

ForceBasicProtectionOnly=1

Supported keyboard layouts

Extended support for following keyboards

Dutch
English
French (Only Canada and Switzerland)
German
